

Our Guiding Principles to help shape the UK's energy future

The need for dialogue, collaboration and unity of purpose across the entire supply chain for all buildings, is greater than ever, so too is the chance to actively become part of the solution. Our buildings must form part of this solution, yet many are old and energy inefficient, whilst new-build rates are slow. Through legislation, incentives and increased awareness, Government, corporate energy users and individuals are driving the need to change our approach to energy use in buildings.

Energy challenges like climate change, fuel security and fuel poverty confront the UK

Changing behaviour

The ultimate goal of Green Gateway is to change behaviour through debate and greater understanding of the energy and environmental issues we all face.

Guided by five core principles, Green Gateway provides us with a compass for the way we do business.

Doing the right thing

We believe that increasing awareness of, and support for, broader energy-production and consumption goals are the right thing for our industry to do.

Green Gateway is closely aligned with national and international targets and supports the creation of a built environment able to help meet them.

Increasing efficiency

Achieving major and lasting reductions in running costs and emissions demands buildings use energy more efficiently.

To do this we believe the priorities that affect the way equipment is selected, installed, maintained and controlled need to change.

Reducing carbon

As those responsible for carbon emissions become increasingly visible and accountable, it is vital that buildings move away from burning fossil fuels causing high emissions.

We strive towards a desired future where electricity is the only end-use energy.

Promoting renewables

Many UK buildings are ripe for the installation of renewable energy systems, to reduce reliance on fossil fuel and the national grid.

Users of renewable energy tend to be more aware of their consumption and more proactive in reducing it, benefiting not only them but society as a whole.

The way we do business

The best solution will always be an integrated solution, that requires more collaboration and diversification from all involved in the industry.

We have changed the way we do business to actively engage with all those required to deliver a truly sustainable built environment.

New solutions

To combat current and future challenges our focus is on developing new solutions and ways of doing business.

Now is the time for action!
